

Selenium Lab 4 Reflection

What went well?

Surprisingly, I had very few challenges with this lab, especially since I used one of the tougher sites (Python Fake Jobs). Since this assignment was broken into separate parts, it was easier for me to know what to complete in each part. Also, I referenced lecture slides, Geeks for Geeks, and past submissions. Also, I was worried that I would run into problems with my Chromedriver since I wasn't able to use it for a previous assignment, however, I had no issues.

What were some challenges you faced?

Since some of the extraction analysis examples in the lecture slides were finding the average price of books, I had to find an additional way to collect data from the Python Fake Jobs. Since there were no salaries listed or quantitative data, I decided to count the number of jobs by job type (`df["Job Title"].value_counts`) on the site and group the jobs based on location (`df.groupby`). With this function, it's easier to see which jobs are located where and which job types are most popular.

Areas for improvement?

Always looking for ways to write code more efficiently. Like is there a way to perform the same tasks and outputs, but with less code? Overall, for my first time, I think I implemented pandas and Selenium pretty well!
